Data Description

Car accident severity

BOUMLIK OUMAIMA

1.   Introduction:

The data used for this project includes all types of collisions from 2004 to present and their related information.

The CSV file contains different types of attributes that can be used to train the model, including a column for labeled data called "severity", which describes the fatality of an accident.

For a good description of each attribute, a Data summary, and further information you can refer to this weblink: [Collision Car Details](#)

2.   How this Data could solve our problem?

The Data set contains all types of collisions and covers a large spectrum of information concerning *Location*, *Time*, *Environmental conditions*, *Infrastructure* state, and even drivers and pedestrian *Attitudes* in the time of accidents. This is exactly what we need to figure out the main reasons leading behind Car accident severity.
